# Forest Statistics for Arkansas Counties - 1988

**F. Dee Hines and John S. Vissage**

## FOREWORD

The Southern Forest Survey, an activity of the Southern Forest Experiment Station Forest Inventory and Analysis work unit, covers the States of Alabama, Arkansas, Louisiana, Mississippi, Oklahoma, Tennessee, and East Texas, and the island of Puerto Rico.

This survey is part of the nationwide Forest Survey originally authorized by the **McSweeney-McNary Act** of 1928. More recent legislation pertinent to the survey mission includes the Forest and Rangeland Renewable Resources Planning Act of 1974 and the Forest and Rangeland Renewable Resources Research Act of 1978. The survey mission is to develop, analyze, and maintain renewable forest resource information. This information is essential for formulation of forest policies and programs.

## ACKNOWLEDGMENTS

The Southern Station gratefully acknowledges the cooperation and assistance provided by the Arkansas Forestry Commission and forest industries in collecting field data. Appreciation is also expressed for the cooperation of other public agencies and other private landowners in providing access to the sample locations.

August 1988

# Forest Statistics for Arkansas Counties — 1988

F. Dee Hines and John S. Vissage

## INTRODUCTION

The tables and figures in this report were derived from data obtained during a recent inventory of the five survey regions and 75 counties in the State of Arkansas (fig. I). Data on forest-nonforest classification using aerial photographs was accomplished for points representing approximately 230 acres. These photo classifications were adjusted based on ground observations at sample locations representing approximately 3,840 acres. Finally, field measurements were made at forest locations on the intersections of grid lines spaced 3 miles apart. At these forest locations, per-acre estimates were obtained from trees measured on ten 37.5 basal area factor prism points.

The sampling methods were designed to achieve suitable sampling errors for estimates of area and volume at the State level. Sampling error increases as the area or volume considered decreases. The sampling errors presented in table I, equal to one standard deviation for the sample data, may be used to construct confidence intervals for population parameters. For example, at the 95 percent confidence level, the confidence interval for growing-stock volume (in million cubic feet) in the State of Arkansas (with a sampling error of 1.9 percent) is

$$18,991.1 \pm 1.96(0.019 \times 18,991.1) = \\ 18,991.1 \pm 707.2$$

where 1.96 is the number of standard deviations. This confidence interval indicates that the actual growing-stock volume lies in the range 18,283.9 to 19,698.3 million cubic feet, unless a 1-in-20 chance of error has occurred.

Sampling errors for any combination of county data in the State may be estimated by the following formula:

$$SE_g = \frac{SE_t \sqrt{X_t}}{\sqrt{X_g}}$$

where:

SE = standard error of estimate  
(expressed as a percent)

X = variable of interest  
(area or volume)

g = group of counties to be combined  
t = total for the State.

For example, the sampling error estimate of growing-stock volume for Polk, Howard, Sevier, and Little River counties is 8.2 percent. Thus, the 95 percent confidence interval for growing-stock volume is  $1,020.2 \pm 164.0$  million cubic feet.

Ownership information is obtained by the same systematic sample outlined above. County courthouse records are used to obtain ownership information for each forested plot. An expansion factor representing timberland area in that county is then applied to the ownership group the plot represents. Next, the ownership groups are totaled for each county. Thus, acreages reported at the county level are estimates and may not exactly match known totals for each ownership category within that county.

In order to achieve greater compatibility among Forest Inventory and Analysis Projects, a new tree grading classification has been initiated for the 1988 Arkansas survey. Tree grade 5 is used for trees currently or prospectively capable of producing at least one 12-foot log or two 8-foot logs in the saw-log portion but not able to produce a 12-foot log in the butt 16 feet. These trees, formerly classed as rough or rotten, are now included in growing stock. Table II shows the impact of this change on volume and growth.

Tables 1-25 were developed to provide compatibility among Forest Inventory and Analysis Projects. Tables 26-35 are supplementary tables and may change from unit to unit or State to State to address specific resource issues.

## DEFINITION OF TERMS

*Average net annual growth.* -Average net annual volume increase for the inter-survey period.

*Average annual mortality.* -Average annual sound-wood volume of growing-stock trees dying from natural causes.

*Average annual removal.* -Average net annual volume of growing-stock trees removed from the inventory by harvesting, cultural operations (such as timber-stand improvement), land clearing, or changes in land use.

*Commercial species.* -Tree species which normally develop into trees suitable for industrial wood products.

*Forest type.* -A classification of forest land based upon the species forming a plurality of live-tree stocking.

*Growing-stock trees.* -Live trees of commercial species. Rough and rotten trees are excluded.

*Growing-stock volume.* -The cubic-foot volume of sound wood in growing-stock trees at least 5.0 inches in diameter at breast height, from a 1-foot stump to a minimum 4.0-inch top diameter outside bark of the central stem, or to the point where the central stem breaks into limbs.

*Live trees.* -Commercial and noncommercial tree species of sapling size or larger.

*Natural stands.* -Stands with no evidence of artificial regeneration. This includes those established by seed tree regeneration methods.

*Noncommercial species.* -Tree species of typically small size, poor form, or inferior quality which normally do not develop into trees suitable for industrial wood products.

*Planted stands.* -Stands with some evidence of planting or direct seeding.

*Poletimber trees.* -Growing-stock trees at least 5.0 inches in diameter at breast height, but smaller than sawtimber size.

*Reserved timberland.* -Productive public forest land withdrawn from timber utilization through statute or administrative regulations.

*Rotten trees.* -Live trees of commercial species that do not contain at least one 12-foot log or two 8-foot logs in the saw-log portion, now or prospectively, primarily because of rot.

*Rough trees.* -Live trees of commercial species that do not contain at least one 12-foot log or two 8-foot logs in the saw-log portion, now or prospectively, primarily because of roughness or poor form. Also included are all live trees of noncommercial species.

*Saplings.* -Growing-stock trees at least 1.0 inches but less than 5.0 inches in diameter at breast height.

*Sawtimber trees.* -Live trees that contain at least one 12-foot log, or two 8-foot logs in the saw-log portion, and meet regional specifications for freedom from defect. Softwoods must be at least 9.0 inches in diameter at breast height and hardwoods at least 11.0 inches in diameter at breast height.

*Sawtimber volume.* -Sound-wood volume of the saw-log portion of growing-stock sawtimber trees in board feet, International 1/4-inch rule and in cubic feet.

*Seedlings.* -Growing-stock trees less than 1.0 inches in diameter at breast height and greater than one foot tall for hardwoods, greater than six inches tall for softwoods, and greater than one-half inch in diameter at ground level for longleaf pine.

*Select red oaks.* -A classification of several red oak species composed of: cherrybark, Shumard, and northern red oaks.

*Select white oaks.* -A classification of several white oak species composed of: white, swamp chestnut, swamp white, chinkapin, Durand, and bur oaks.

*Site class.* -A classification of forest land in terms of inherent capacity to grow crops of industrial wood.

*Stand-size class.* -A classification of forest land based on the diameter class of growing-stock trees on the sampled area; that is, sawtimber, poletimber, or sapling and seedling.

*Timberland.* -Forest land that is producing, or is capable of producing, crops of industrial wood and not withdrawn from timber utilization.

Timberland is synonymous with “commercial forest land” in prior reports.

**Treerule.** -A classification of the volume of the saw-log portion of sawtimber trees, based on: 1) the log grade of the butt log, or 2) ability to

produce at least one 12-foot or two 8-foot logs in the upper-section of the saw-log portion.

**Woodland.** -**Forest** land incapable of yielding crops of industrial wood because of adverse site conditions.
